MyDomainsHub

Moving your domain? Check these first.

Three checks before you start, then two steps.

For anyone changing registrar

Swipe →

Check 1

Is your DNS at your registrar?

1. Some registrars delete your DNS records when a domain leaves.

2. Your website and email can go with them.

3. Copy the records to your web host and point your nameservers there first.

Check 2

Can you read the owner email?

1. Your current registrar may email the owner to confirm the move.

2. If privacy protection forwards it, make sure it still reaches you.

Check 3

Is it more than 60 days old?

1. Registrars can refuse a transfer within 60 days of a registration or the last transfer.

2. A recent change of owner can lock it for 60 days too.

3. Check the dates with your current registrar.

Step 1

Unlock it, get the code

1. Turn off the transfer lock at your current registrar.
2. Ask for the auth code, also called the EPP or transfer code.
3. They must give it to you within five days.

Step 2

Enter it, pay, wait

1. We check the code with the registry before you pay, in naira.

2. Where the registry adds a year, that year is included.

3. If your old registrar hasn’t answered in five days, the registry completes the move.
